

What does “provisional” data mean?

- The graph harvests data from USGS and OSE gauge websites that are marked “provisional.” At the end of each year, those agencies may adjust the data to account for calibration changes, known instrument problems, debris stuck in gauges, ..., but the PVID Gauge Explorer won’t be updated with such changes. If a gauge sends no reading to OSE for a long time, the Gauge Explorer assumes a linear interpolation between readings.

How are the data manipulated in the graph?

- DATA ADJUSTMENTS = None and GRAPH = Flow (CFS) shows exactly the data harvested from USGS and OSE.
- DATA ADJUSTMENTS = Adjust: Hover your mouse over this button to see what it does.
- GRAPH = Total (AF) adds up each gauge’s CFS during the displayed time interval, showing the accumulated total as a function of time. A linear interpolation between gauge readings is used. Long intervals of “no reading” of a gauge will be shown as a dashed line on the graph.

None of these manipulations changes the CFS table itself---only how the data are displayed.

Who created this website?

- Anthropic Claude Opus 4.8 wrote the code. Greg Swift guided Claude after consulting with several acequia officers.

Copyright?

- None. Other irrigation districts are welcome to copy the page source and adapt it to their own needs.
